COLLECT PATIENT INFORMATION WITH INSTANT MEDICAL HISTORY – DISCRETE

Software that gathers patient data

A part of NextGen® Enterprise EHR, Instant Medical History – Discrete enables patients to begin their own medical history from the waiting room or home.

### Saving practices time while improving the patient experience

Studies show a majority of the patient visit note can be collected in advance.[1] Instant Medical History – Discrete uses branching technology to enable patients to progress quickly through an automated questionnaire via a hosted web service. In the background, software translates the patient's answers into clinical terminology, organizes the information, and passes the details to NextGen Enterprise EHR. Information gathered is stored in NextGen® Clinical Templates.

Instant Medical History – Discrete helps your practice:

- Reduce data entry time and the number of clicks for office staff

- Reduce office visit time and increase the number of patients your practice can accommodate

- Increase time for providers to focus on patient care

- Enhance patient communication, engagement, and satisfaction

- Provide more comprehensive patient history information to providers

- Significantly enhance documentation quality

Three steps to improved provider productivity

1. Patient answers questions:
   - History of present illness
   - Review of systems
   - Medical, family, and social history

2. Branching technology leads patients through an automated interview.

3. Data is organized into a structured visit note and saved in NextGen Clinical Templates.
